

$C_1$  is a frequency band coefficient. Technically and cost-effectively the values of the frequency bands vary. This coefficient enables frequency fees to be adjusted to the usability of the licence holder's frequency band. With the frequency band coefficient it is also possible to try to direct the use frequencies to non-congested frequency areas. The value of the frequency band coefficient  $C_1$  varies due to the frequency band used. According to the table below the frequency band coefficient, for example, is 1.5, if the transmitter in the radio licence operates on the frequency 98.6 MHz.

| <b>Frequency band</b> | <b><math>C_1</math></b> |
|-----------------------|-------------------------|
| 0 – 28 MHz            | 0.2                     |
| 28.001 – 87.5 MHz     | 0.9                     |
| 87.501 – 108 MHz      | 1.5                     |
| 108.001 – 146 MHz     | 1.7                     |
| 146.001 – 174 MHz     | 1.9                     |
| 174.001 – 380 MHz     | 2.0                     |
| 380.001 – 470 MHz     | 2.0                     |
| 470.001 – 862 MHz     | 2.0                     |
| 862.001 – 960 MHz     | 1.4                     |
| 960.001 – 2200 MHz    | 1.0                     |
| 2200.001 – 3100 MHz   | 0.6                     |
| 3100.001 – 5000 MHz   | 0.4                     |
| 5000.001 – 10700 MHz  | 0.3                     |
| 10700.001 – 19700 MHz | 0.25                    |
| 19700.001 – 39500 MHz | 0.2                     |
| 39500.001 – 55000 MHz | 0.1                     |
| Above 55000 MHz       | 0.03                    |
