Telecommunications Markets in the Nordic and Baltic Countries 2018

5. September 2019
About the database

- The database was established in 2007 by the Nordic countries. The Baltic States are included since the spring of 2013.

- Consists of selected variables that are comparable between the countries.

- A dynamic database that will change as the telecom markets develop.

- The figures are collected and validated by the Nordic-Baltic working group on statistics and definitions.

- Unless otherwise stated, the sources for all figures are the national regulatory agencies and/or the national statistical agencies of each country.

- Graphs included in this publication cover the years 2013 – 2018. Previous years are available in the database only. The variables are stated as of the end of the year. Time series for each country are displayed from the year where data are available. Due to this, the length of time series may vary.

- Graphs include both private and business customers unless otherwise stated.

- The graphs are usually expressed as per capita, which means the amount of each variable (both private and business) divided by the relevant country’s population.

- For more information, see the PTS statistics portal: http://statistik.pts.se/nordic-baltic-telecom-market/
Population

Population (in thousands) as of year end in the Nordic and Baltic countries. As most of the graphs in this presentation are scaled based on the population in each country, it should be noticed that the population is growing in some countries while decreasing in others. In this publication only the population figures from 2013 to 2018 are shown.

1. Mobile services
Mobile services

- Finland was the only country with over 1.7 mobile subscriptions per capita. In the other countries the number varied between 1.1 and 1.6 subscriptions per capita in 2018. While there are differences between the countries, it can be said that the total number of mobile subscriptions generally is stagnating.

- The number of mobile call minutes was still growing in Sweden, Lithuania and Estonia while stagnating in the other countries. The highest usage per capita was observed in Latvia.

- Data traffic in mobile networks continued to increase in all of the countries. Finland had by far the largest data volumes, 30.7 Gbyte per capita and month, and traffic continued to grow fast. An important factor behind this development is the popularity of subscriptions without data caps in Finland. Volumes in the other countries ranged from 4 to 14 Gbyte per capita and month.

- The number of machine-to-machine (M2M) SIM cards was growing in all of the countries. The 2018 figure for Sweden is based on the estimated number of M2M SIM cards used inside the country. No corresponding estimates are available for previous years. More than half of all M2M SIM cards with Swedish numbers are used outside of the country. The main reason for this is that Telenor’s global M2M operations are headquartered in Sweden.
1.1 Mobile subscriptions per capita

Number of mobile subscriptions (GSM/UMTS/LTE) for voice and data divided by population. Pre-paid subscriptions are included and must have been active within the last 3 months of the period. M2M subscriptions are not included.
1.2 Mobile call minutes per capita in a month

Most of the mobile subscriptions today include unlimited minutes or at least a very large number of minutes. The figures exclude international roaming.
1.3 Share of mobile minutes of all originated minutes

“All originated minutes” are the sum of all fixed minutes and all mobile minutes.
1.4 Average number of SMS messages sent per capita in a month

A2P messages is included in the numbers from Estonia, Finland, Latvia and Lithuania.
1.5 Data transferred over mobile networks per capita in a month (Gbytes)

Includes both uploaded and downloaded traffic. Data roaming abroad is not included. Calculated by the binary system (1 GB = 1024³ B).
1.6 Machine-to-machine (M2M) SIM cards per capita

Includes SIM cards sold specifically to be used with or between machines in, for example, energy consumption meters, cars and surveillance cameras. M2M SIM cards per capita is highest in Sweden, followed by Norway. The 2018 figure for Sweden is based the estimated number of M2M SIM cards used within the country. No corresponding estimates are available for previous years.
2. Fixed call services
Development of fixed call services

- The number of fixed telephony subscriptions per capita as well as the number of fixed call minutes was decreasing in all countries, and there is no sign to indicate any change in the future. Though the share of mobile minutes of all originated minutes varied between 80 and 97 percent in 2018, the relative amount of fixed call minutes is steadily decreasing in all countries.

- There are major differences between the countries in the number of IP telephony (managed VoIP) subscriptions per capita and the numbers are developing differently to some degree as well. The Danish figures include both managed and unmanaged VoIP.

- In Sweden, Denmark and Iceland there were above 0,1 IP telephony subscriptions per capita. However, Iceland was the only country where subscriptions continued to grow. In Estonia, Finland, Lithuania and Norway, the number of VoIP subscriptions per capita was 0,04 or lower.

- The Latvian and Icelandic incumbents plan to gradually switch their entire fixed networks over to IP technology and eventually shut down the PSTN networks. IP telephony is often bundled with other services such as fixed broadband and TV. In those cases the IP telephony part of the bundle may be inactive.
2.1 Fixed telephony subscriptions per capita

Includes PSTN, ISDN and IP telephony. The figures include both business and private subscriptions, which may differ significantly in terms in traffic generated, since a business customer may have many users of the same fixed telephony connection (e.g. ISDN).
2.2 IP telephony subscriptions per capita

The increase in Iceland is due to the closing down of the PSTN network, which is scheduled for 2020.
2.3 Fixed call minutes per capita in a month
3. Broadband services
Development of broadband services

- Denmark had most fixed broadband subscriptions: 0.44 per capita in 2018. The share was over 0.27 in all of the countries.
- When comparing the penetration of dedicated mobile data subscriptions, Finland was well above the rest of the countries with 0.4 subscriptions per capita. Latvia had the second highest penetration at 0.33, followed by Denmark at 0.20.
- When adding dedicated mobile broadband subscriptions to fixed broadband subscriptions, Finland had a penetration rate of 0.72 subscriptions per capita, followed by Denmark with 0.64 and Latvia with 0.60 subscriptions per capita.
- The highest penetration rate for mobile voice and data subscriptions, 1.16 per capita, was found in Finland. Denmark had the second highest penetration rate at 1.15, followed by Sweden at 1.07.
The share of fiber subscriptions of all fixed broadband subscriptions was highest in Lithuania at 74 percent followed by Latvia and Sweden, both with 67 percent in 2018.

Sweden was well above the other countries in terms of broadband subscriptions with speeds of 100 Mbps or more downstream. The Swedish penetration rate for 100 Mbps or more reached 0.29 subscriptions per capita, while the second highest penetration rate (0.24) was found in Iceland. The penetration rate continued to increase in all of the countries during 2018.

When combining fiber and cable subscriptions per capita, Sweden had the highest penetration rate, 0.33, followed by Norway with 0.32 and Denmark with 0.28 subscriptions per capita. The combined penetration rate for cable and fiber was increasing in all countries, mostly due to growth in fiber subscriptions. Iceland has no cable networks.

Due to the increase in fiber subscription, there is a steady increase in broadband upload speeds.
3.1a Fixed broadband subscriptions per capita

The decrease for Lithuania in 2017 is due to a switch from WiMAX (fixed) to LTE (mobile) technology by one of the broadband providers.
3.1b Residential fixed broadband subscriptions per capita

The decrease for Lithuania in 2017 is due to a switch from WiMAX (fixed) to LTE (mobile) technology by one of the broadband providers. Figures not available for Latvia.
3.2 Number of dedicated mobile data subscriptions per capita

Subscriptions without voice and SMS/MMS messaging services. The broadband service is typically used via a dongle, tablet or mobile router.
3.3 Number of fixed and mobile broadband subscriptions per capita

Includes all fixed broadband subscriptions and dedicated mobile data subscriptions. The 2017 drop for Lithuania is due to a change in definitions.
3.4 Number of mobile voice and data subscriptions per capita

Subscriptions where both mobile data and voice are included. Excludes data add-on subscriptions and dedicated mobile data subscriptions.
3.5 Fixed broadband subscriptions with a marketed downstream capacity of 30 Mbps or more, per capita

![Bar chart showing the number of fixed broadband subscriptions per capita in various countries over the years 2013 to 2018.](Image)
3.6 Fixed broadband subscriptions with a marketed downstream capacity of 100 Mbps or more, per capita
3.7 Share of fiber subscriptions of total fixed broadband subscriptions

Fiber includes both FTTH and FTTB. There was a change of definitions in Finland in 2017.
3.8 Fixed broadband subscriptions via fiber and cable networks per capita

Fiber and cable will be key to meeting the EU’s broadband target that all households should have access to networks offering a download speed of at least 100 Mbps, which can be upgraded to 1 Gbps, in 2025.
4. TV services
Development of traditional pay-TV services

- Cable TV subscriptions were most frequent in Finland with 0.31 subscriptions per capita in 2018.
- Satellite TV subscriptions were most common in Norway where, despite continuous decline, the number was still almost 1 subscription per 100 inhabitants. This is significantly higher than in the other countries.
- IPTV penetration was highest in Iceland, where there is no cable TV or satellite TV. In 2018, there were 0.28 IPTV subscriptions per capita in Iceland. IPTV penetration is increasing in all of the Nordic and Baltic countries. IPTV includes both DSL and fiber platforms.
- Digital terrestrial TV penetration was highest in Latvia and Estonia, with 0.06 subscriptions per capita.
4.1 Number of pay-TV subscriptions per capita 2018

In Sweden and Norway, only pay-TV is included in digital terrestrial TV (DTT). In Iceland there is no cable or satellite TV and IPTV figures include both pay-TV and free-to-air. Data on DTT subscriptions are not available for Iceland. Data on satellite TV and DTT subscriptions are not available for Finland.
5. Market shares
5.1 Market share of leading mobile operator

Operator with the largest market share, based on subscriptions. Market shares include subsidiaries. Mobile subscriptions include all mobile voice and data subscriptions, including dedicated mobile data subscriptions.
5.2 Market share of leading operator in fixed call services

Operator with the largest market share, based on subscriptions. Market shares include subsidiaries. Fixed telephony subscriptions include PSTN, ISDN and IP telephony subscriptions (managed VoIP).
5.3 Market share of leading operator in fixed broadband services

Operator with the largest market share, based on subscriptions.

Note: The above chart illustrates the investments in tangible fixed assets from 2013 to 2018 for the Nordic-Baltic countries, with Iceland leading in 2018 at 247 EUR per capita, followed by Norway at 189 EUR.
6.2 Revenues per capita (EUR/PPP)

Retail revenues from mobile call services, fixed call services and broadband services. Revenues from TV and international roaming are not included. Revenues exclude VAT. Revenues per capita in 2018 ranged between 244 and 446 EUR in the countries.
7. Broadband coverage
Definitions of broadband coverage

- In this publication, broadband coverage refers the proportion of households (permanent dwellings) who can get broadband access with certain characteristics.

- This includes households with physical broadband access (“homes connected”). It also includes households without physical broadband access that can order a broadband connection and get it installed by a broadband provider under certain, reasonable conditions (“homes passed”). Hence, the definition of broadband coverage in this publication aims to provide a measure of the total availability of broadband.

- The figures for Iceland and Lithuania refers only to the proportion of households with physical broadband access (“homes connected”). Data for Latvia are not available.

- The calculation of broadband coverage is based on data from broadband providers in each country.

- Data for each country has been collected at different times in 2018 and published in the autumn of 2018 to spring 2019.

- Methods and definitions vary to some extent between the countries. Numbers that are close to each other should therefore not be interpreted as significant differences in coverage.
7.1 Coverage of fiber broadband, including fiber LAN (%)

For Iceland and Lithuania, data refer to homes connected, for all other countries data refer to homes passed. Data for Latvia is not available.
### 7.2 Coverage of fixed broadband with download speed of 30 Mbps or more (%)

For Iceland and Lithuania, data refer to homes connected, for all other countries data refer to homes passed. Data for Latvia is not available.
